API Reference

<cpanel LogIP="Log()">

Logs the username, remote IP address and timestamp in the HCCLogIP database created by the administrator (see installation instructions). Usernames are truncated to 8 characters. If an error occurs, `$CPERROR{ 'HCCLogIP' }` is set to 1, `$CPERROR{ 'HCCLogIP_errno' }` returns with the error code, and `$CPERROR{ 'HCCLogIP_errstr' }` returns with an error string.

Note: the `HCCLogIP` C script is a setuid root executable. You may want to review it before running it in your server.

Changelog

0.2.1 Beta – May 11, 2005

Fixed lang function to account for Cpanel's cachelang mechanism.

0.2 Beta – September 23, 2003

Changed API call name.

Removes the *notify* parameter and uses `$CPERROR` variables instead.

Database is now accesible by root only. The old mysql configuration file is no longer used, `/root/.my.cnf` is used instead.

0.1 Beta – March 25, 2003

First entry in Changelog.
